1 Creating a New Scenario

From the front end menu, select the Routes option. You will then be presented with a list of available routes.

Select the route on which you want to create a scenario, which will become highlighted and press the Scenario option at the bottom of the screen.

You will now see a list of scenarios available for that route. To create a new scenario you need to enter the Free Roam Scenario for that route.

Select the Free Roam Scenario so that it is highlighted and press the Edit button.

The route will now load.

2 Placing a Scenario Marker

The game has loaded the Free Roam Scenario and the editor is in scenario mode. You can tell this because the scenario button on the upper tab is highlighted.

When you place and name a new scenario marker, your new scenario will be created. To place a new scenario marker, left click the Scenario Marker button on the middle tab. You will see a list of available marker types.

Select the Standard Scenario Marker so it is highlighted and drag the mouse into the main window. You will see that a scenario marker is attached to the cursor. Place the scenario marker by clicking the left mouse button.

NOTE: When placing a free roam scenario marker, the location and orientation of the marker is important as it determines the position of the camera when your new scenario loads. You can move and rotate the scenario marker in the same way as any other object. For Standard Scenario Markers the starting camera location is attached to the train, so the position of the marker is less important.

Now that the initial marker has been placed you can begin to edit the scenario properties.

3 Editing Scenario Properties

To edit the scenario properties, double left click the scenario marker. This will reveal a properties tab on the right hand side of the screen. You will probably want to pin this tab so that it is permanently visible by clicking the pin icon. Once you have double clicked a scenario marker you are effectively in that scenario and are editing it directly.

Currently all the fields on the properties tab are filled with the default values. To edit a field, left click on it and type in new text or values with the keyboard. Holding your mouse cursor over the icon beside each field will bring up a descriptive tool tip.

The bottom two fields, Weather and Season are pull down menus.

Below is a list of each field and a description of what they mean:

Scenario Name: This is the name which is displayed in the scenario list for the route.

Description: On the scenario list for the route, when this scenario name is selected the text here is displayed. The text here should provide a synopsis of what the scenario entails to give a feel of the scenario before committing to play it.

Briefing: Once the scenario has been selected and has loaded, the text in this field is the first thing a player will see. This can contain more technical information.

Date: This is the date of the scenario in dd/mm/yyyy format, and is displayed in the scenario. The numbers entered here will not determine the season or weather and are purely for information purposes.

Rating: This is an arbitrary number value to easily show the relative difficulty of the scenario, where 1 is easy and higher numbers show greater difficulty.

Duration: This is the approximate duration, in minutes, of the scenario. This is a guide for people wanting to play the scenario and has no other impact on the scenario.

Start Time: This is the start time of the scenario, based on the 24 hour clock using hours and minutes fields. The values entered here will directly affect the look of the scenario as this determines the time of day.

Weather: There are eight default weather patterns to choose from. Weather patterns can be edited in the blueprint file.

Season: Selecting a season will affect the textures on the route, but will not affect the weather.

To save the scenario, either press F2 or enter drive mode by pressing the large Play button on the bottom right of the screen.

In drive mode, the time of day and the season will update the look of the route. You will notice there is no train or instructions set up yet; these features will be covered in later documents.

Exiting to the main menu you will now see the newly named scenario in the scenario list for the route.

4 Editing an Existing Scenario

You can edit scenarios that already exist by selecting the scenario name from the front end menu and pressing the Edit button.

The scenario will then load with the camera close to the scenario marker. Double click the scenario marker to edit the scenario properties.
