1 Placing a Pick Up Passengers Instruction

The next instruction type is the Pick up Passengers instruction and is located in the middle of the upper tab. This is used on passenger scenarios.

To add this instruction you press the Pick Up Passengers button so that it is highlighted, then click on the player locomotive.

You can see that the instruction disc sits behind previously placed instructions in a row on top of the locomotive. Instructions are carried out in order from front to back so in the example image the Stop At Destination instruction will need to be completed before the Pick Up Passenger.

2 Pick Up Passengers Properties Tab

To edit the Pick Up Passengers instruction properties, double left click the disc on the locomotive. This will reveal a properties tab on the right hand side of the screen. You will probably want to pin this tab so that it is permanently visible by clicking the pin icon.

Currently all the fields are empty.

Below is a list of each field and a description of what they mean:

Add Instruction: This is the main body of the instruction. To set a Passenger pick up destination you first click the green plus sign then select a platform marker in the world editor.

Once a destination has been added it appears in the list. Further Pick Up Passenger instructions can be added and will appear stacked underneath.

The instructions will complete from top to bottom.

Delete Instruction: To delete an instruction from the list, firstly select the instruction you want to remove and then press the delete icon which looks like a dustbin.

Find: Clicking the magnifying glass icon will bring up a list of nearby available locations. Selecting an item from this list will create a Pick Up Passengers instruction for that destination and add it to the list.

Display Message: The text entered into this field is displayed as a pop-up message in-game when all instructions in the list above are completed successfully.

Achievement Text Successful: Similar to the above message, except this message is displayed if the whole scenario is completed successfully. This field does not need to be filled in unless it is on the last instruction disc of the scenario.

Achievement Text Unsuccessful: This displays a message if the instruction is not completed successfully. In the case of a Pick Up Passenger instruction, this would be if the player failed to stop at the platform and overshot.

This would not necessarily mean total failure of the entire scenario if later instructions are still completable.

3 Editing Individual Pick Up Passengers Instructions

The separate destination instructions in the list show the name of the location of the Passenger Pick Up, the anticipated arrival time, the anticipated departure time and the average expected performance %.

Handle Off Path: The dispatcher automatically calculates the best path for the train based on all the values contained in the scenario. Deviating from this path results in an error. This could end up failing the scenario.

There will be times, however, when it should be correct for the player to leave this pre-calculated path. An example would be in yard activities, where the player should be free to use any path through the yard as long as the instruction gets completed.

Leaving the box unchecked means the path does not have to be adhered to, and no error will be given for leaving the path until this instruction is completed.

Checking the box means the path in enforced and the player must stick to it for this instruction.

% Performance: The average expected performance is set to 75% by default. Adjusting this value higher will create a stricter timetable and changing the value lower will create a more relaxed timetable. If this value is edited the anticipated arrival and departure times on this and all subsequent instructions will be updated.

Editing this value is a good way to control the speeds of AI traffic on the route.

4 Viewing the Instructions

In Drive mode you can check the Assignment Assistant and see the instructions as the end user would when playing the scenario.

This is how a single Pick Up Passengers instruction appears, when placed after the previous Stop At Destination instruction.
